The Englo system was installed to eliminate the fugitive dust escaping from the lime silo discharge and on the conveyor and silo during filling operations at this facility in West Virginia. The installation uses an Englo Type 18 Dust Extractor and Pre-Filter Box. Two pickup points with oversized hoods were installed to collect dust at the silo discharge point on the conveyor and an upper point when the coal is fed onto the belt. A third suction line was connected to the Silo overflow tube to provide negative suction on the silo as it is being filled.
